### С

ROSS SECTION DIAGRAM			
Artists name	-		
Two diagrams may be required where high v	wo diagrams may be required where high variability exists across a site (suggested information to include is shown in the diagram below).		

Bankfull width: Width of the channel at its maximum capacity; above which flooding of the surrounding area would occur. Measured perpendicular to the course of the river, with extent estimated based on vegetation type, high water marks on trees/rocks (including material carried by previous high-water events) and gradient of the bank.

Channel depth: The height of the banks from the base of the sediment (standing in the middle of the stream) to the top of the tallest bank.

**Riparian zone:** an area dominated by typically riparian-dependent vegetation species (refer to field guide for riparian species common in the south-west of WA). Note: a distinct riparian is not always expected or obvious (e.g. rivers flowing through channels in bedrock or within intact forested catchments it may be narrow).

Adjacent zone: The area extending beyond the riparian zone – indicate the type and width of vegetation or land use present (as a guide, include up to 100 m width of adjacent vegetation or land use on each bank).

Date//	Site code	Recorder name	Government of Western Australia Department of Water and Environmental Regulation

> 2.00			

### BANK AND CHANNEL SHAPE (circle all applicable for each category)

### **CHANNELISATION - ARTIFICIAL**

Signs of channelisation (circle)	No	Yes (complete table below)
If yes, is channelisation due to (circle & describe below):	Direct causes	Indirect causes

**Direct causes:** deepening and straightening by humans to increase water flow (e.g. to reduce flooding). **Indirect causes:** deepened systems with more vertical banks due to bank erosion and bed scouring; a result of increased flows from changes such as catchment clearing or hydrological modifications.

# SOUTH WEST INDEX OF RIVER CONDITION - FIELD SHEETS GENERAL SITE DESCRIPTION

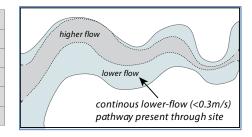

### **FLOW CONDITIONS**

Flow meter/method used	

Flow condi	tions (flow in m/s)			Re	cord			Date	Comment
Assessmer	nt site (circle)								
Flow catego	A B C			; D					
Upper flow i	N/A	<0.1	0.1-0.3	0.3-0.6	0.6-1.5	>1.5			
Lower flow i	N/A	<0.1	0.1-0.3	0.3-0.6	0.6-1.5	>1.5			
For sites	Presence of rest areas 1		No	1		Yes			
with flows > 0.3 m/s	Presence of flow pathway below 0.3 m/s (see diagram below)	No		<0.1		0.1 -	0.3		
Macroinver	tebrate sampling location								
Minimum flo	w								
Maximum flo	ow								
Water qual	ty logger location							<u>I</u>	1
Flow at dep	oyment/maintenance								
Flow at retri	eval n assessments)								

<sup>&</sup>lt;sup>1</sup> Rest areas are areas of low-flow (<0.1m/s) where aquatic fauna can reside or recover when negotiating higher flows. These habitats are often seen in wider and/or deeper sections (e.g. pools), edges of streams (outside of main flow pathway) or around in-stream structures (backwaters).

Flow category	Description
Α	Dry section(s) present (disconnected)
В	Flow not observed or detected with flow meter
С	Flow observed but below 0.1m/s (lower detection limit of meter)
D	Uniform flow (e.g. common in drains or under flood conditions)
E	Variable flow (flows recorded across multiple flow-ranges)

# FLOW CONDITIONS – ADDITIONAL OBSERVATIONS OR ANECDOTAL EVIDENCE

# SOUTH WEST INDEX OF RIVER CONDITION - FIELD SHEETS CONNECTIVITY

#### **CONNECTIVITY ASSESSMENT DIAGRAM**

Include any features (artificial and/or natural structures) that may affect connectivity e.g. v-notch weir, culvert, dry sections, riffle. See example diagram below. Examples of feature are provided in the SWIRC field guide.

	Downstream of site	Within site	Upstream of site
Approx. length of area assessed (m)			
Location(s) of features			
Feature length (m)			
Description of feature(s)			

		Do	wnstream			Within	site		Upstream			
Length of area (m)			65			100			10			
Location(s) of features	Not assessed									Could not assess		
Feature length (m)		15	30	20	15	30	55	5	5			
Description	v-notch	weir >	dry			riffle (>10cm passage)			dry	Inaccessible (private property)		

# ARTIFICIAL STRUCTURES

Complete this table for any artificial features (e.g. weirs, culverts) within the total area assessed above. NOTE: This information is required for the in-stream structure geodatabase only, not for RiverBank.

Structure type #	Latitude (-°S) or Northing (m)	Longitude (°E) or Easting (m)	GPS Accuracy (m)	Way- point <sup>1</sup>	In				eight (cr ld guide]	Comments (e.g. effect of structure on flow/turbulence, presence of bypass, part of gauging station)	Photo & diagram <sup>2</sup> (tick)	
					<2	2-10	10-30	30-100	100-500	>500		
					<2	2-10	10-30	30-100	100-500	>500		
					<2	2-10	10-30	30-100	100-500	>500		
					<2	2-10	10-30	30-100	100-500	>500		
					<2	2-10	10-30	30-100	100-500	>500		

<sup>#</sup> Structure types: weir or flow control structure (describe type of structure and whether it forms part of a gauging station), ford/causeway, culvert (box or pipe), dam, bridge, other (describe). Refer to the SWIRC field guide for examples of the different structure types.

<sup>&</sup>lt;sup>1</sup> Way-point code as stored in GPS

# **SOUTH WEST INDEX OF RIVER CONDITION - FIELD SHEETS AQUATIC HABITAT**

#### STREAM HABITAT DIVERSITY

Habitat area (	% cover)
Channel	
Pool	
Riffle	
Run	
Total	100 %

Aquatic plants and macroalgae (excluding filamentous) (% cover)								
Area of site covered		Species (take photos if unknown)						
Proportion emergent & inundated rushes/sedges								
Proportion submerged								
Proportion floating								
Total	100							

Woody debris (circle one in each column)							
Dive	rsity	Abundance					
Expected (i.e. pre-European)	Expected (i.e. pre-European) Observed		Observed				
Unknown	None	Unknown	None				
Wood of similar size	Wood of similar size	Sparse (few pieces)	Sparse (few pieces)				
2-3 different sizes	2-3 different sizes	Moderate	Moderate				
Variety of sizes	Variety of sizes	Dense (throughout most of site)	Dense (throughout most of site)				

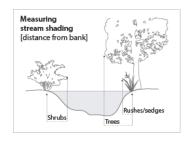

Types of biological substrate and sizes of wood present (circle all relevant types and all applicable sizes of wood present)										
Epiphytes	Algae	Detritus	Leaves	Wood diameter (cm):	< 5	5-9	10-49	≥ 50		

Biological substrate cover	Density (circle) [1= sparse, 5 = dense]
0 - 9%	0 1 2 3 4 5
10 - 29%	1 2 3 4 5
30 - 59%	1 2 3 4 5
60 - 100%	1 2 3 4 5

Physical substrate (circle all relevant categories)					
Bedrock Gravel (4 -16mm) [raw sugar - marble]					
Boulders (> 256 mm) [soccer ball]	Sand (1 – 4 mm)				
Cobble (64 - 256 mm) [cricket - soccer ball]	Silt (<1 mm)				
Pebble (16 - 64 mm) [marble - cricket ball]	Clay (0.002mm)				

% Bank length (circle one in each category)											
Overhanging roots draped in water Overhanging banks							•	draped in v			
None	1 - 9	10 - 49	50 - 100	None	1 - 9	10 - 49	50 - 100	None	1 - 9	10 - 49	50 - 100

Stream shading	Percentage of bank length		Average distance from ban		
Avg. stream width m	(	%)	(m)		
	LB	RB	LB	RB	
Tree overhang					
Shrub overhang					
Grass/sedges/rushes overhang					

# WATER AND SEDIMENT (circle the appropriate description for each category)

Sediment deposition	None or	Not	Obvious	Type of sediment	Sand	Silt	Other:
Sediment deposition	minor	obvious	Obvious	Type of sediment	Said	5	Other.

Water odours	Water Oils	Turbidity Tannin staining * Water			Sediment Plume **	Sediment oils	Sediment odours	
Normal/None	None	Clear	Clear	0%	0%	Small	Absent	Normal/None
Anaerobic	Slick	Slight	Slight	1 to 9%	1 to 9%	Moderate	Light	Anaerobic
Sewage	Sheen	Turbid	Light tea	10 to 49%	10 to 49%	Large	Moderate	Sewage
Petroleum	Globs	Opaque	Dark tea	50 to 74%	50 to 74%		Profuse	Petroleum
Chemical	Flecks		Black	75 -100%	75 -100%			Chemical

<sup>\*</sup> tannin staining can be confused with turbidity when combined with systems containing fine suspended sediment (if hard to assess use filtered water sample)
\*\* relates to amount of fine sediment generated and time take to settle (i.e. a large plume may extend for over one meter diameter)

# AMOUNT OF EROSION

Length of bank affected	Tick one for each bank			
(irrespective of severity)	LB	RB		
0 - 4 %				
5 - 19 %				
20 - 49 %				
50 - 100 %				

#### **EROSION AND BANK STABILITY**

SEVEDITY of arcsion and bank stability lover the 100m site!	Tick one fo	or each bank
SEVERITY of erosion and bank stability [over the 100m site]		RB
Severe: LITTLE TO NO STRUCTURAL INTEGRITY  Banks are predominantly bare. Significant sections of erosion on outside bends (undercutting/slumping) and straight stretches (sediment deposits). Exposed roots obvious (where applicable), with significant loss of vegetation in eroding areas. Channel & bank shape and depth likely to change in near future.		
High: POOR STRUCTURAL INTEGRITY Evidence of bank instability (undercutting/slumping); with signs of soil loss from banks, and areas of sedimentation (sandbars/toes) and scouring. Some exposed roots (where applicable), with loss of vegetation in eroding areas. Erosion typically around outside bends.		
Low-Moderate: GOOD STRUCTURAL INTEGRITY  Banks relatively stable – exposed and superficially eroding bank (erosion doesn't penetrate deeply into bank wall) or stabilised by only exotic grasses. Little likelihood of significant change to channel/bank shape, depth or loss of bank material in near future.		
Minor: EXCELLENT STRUCTURAL INTEGRITY  Banks stable and mostly intact (minor slumping, undercutting or bare banks expected naturally): stabilised by vegetation or bedrock.		

Factors affecting bank stability		Tick one or more for each bank			
,	LB	RB			
None					
Feral animals					
Livestock access [complete table below]					
Human access					
Cleared vegetation					
Runoff					
Drain pipes					
Flow and waves					
Culvert, bridge, dam					
Other (specify)					

Stabilisation works	Tick one or more for each bank				
	LB	RB			
None					
Rock wall protection					
Bank matting					
Logs/planks strapped to bank					
Concrete lining					
Revegetation plantings					
Fenced human access (deterrent)					
Fenced livestock access					
Fenced stock watering points					
Other (specify)					

# LIVESTOCK ACCESS (tick impacts (minor or major) observed for each category)

CATEGORY	Minor	Tick	Major	Tick				
Vegetation damage	Only small patches of vegetation grazed		Most groundcover vegetation grazed					
Bank damage	Isolated areas (1 or 2) of livestock damage		Near continuous livestock damage to stream					
Pugging	Isolated (1or 2) areas of pugging		Extensive pugging along the stream length					
Manure	≤2 significant manure deposits per site		>2 significant manure deposits per site					
Tracks	≤1 track per site		>1 track per site					
Types of livestock pres	Types of livestock present

# SOUTH WEST INDEX OF RIVER CONDITION - FIELD SHEETS PHYSICAL FORM and POTENTIAL POLLUTION

# POTENTIAL POLLUTION SOURCES

Record sources of potential pollution (actual pollutants may not be present / visible).

POINT SOURCES of potential pollution	Within site Tick all applicable	Source O/A/P*
None		
Pipe or drain - flowing		
Pipe or drain - not flowing		
Drum(s) or container(s)		
Dead (large) animal in river		
Livestock access to river bed		
Road crossing - sealed		
Road crossing - unsealed		
Road works - crossing /bridge		
Road bridge		
Railway bridge		
Other (describe)		

<b>POINT SOURCES</b> of potential pollution Ad-hoc notes and observations
Upstream from site

NON-POINT SOURCES of potential pollution	Within site, <50m from banks Tick all applicable	Source O/A/P*
None		
Agriculture (Ag) - crops		
Ag - turf/nursery/market garden		
Ag - vineyard/orchard		
Ag - horses		
Ag - cattle - dairy		
Ag - cattle - meat		
Ag – cattle/sheep - feed lot		
Ag - sheep/goat/lamas etc		
Ag - chickens		
Ag - pigs		
Plantation - pine		
Plantation - blue gums		
State forest – recently logged		
Waste disposal - landfill		
Road along river - sealed		
Road along river - unsealed		
Road works along river		
Railway along river		
Residential - urban		
Residential - rural		
Commercial - office/shop		
Education establishment		
Recreation - park/oval		
Recreation - water-based		
Industry - heavy/light/rural		
Industry - mining		
Sewage treatment plant		
Other (describe)		

NON-POINT SOURCES of potential pollution Ad-hoc notes and observations
Within site but > 50m from banks
Upstream from site

# **SOUTH WEST INDEX OF RIVER CONDITION - FIELD SHEETS MACROINVERTEBRATES**

### SAMPLE COLLECTION

Time collected (24 hr)	Collected by	
Picked by		
Chain of custody #	Sample #	

### MACROINVERTEBRATE HABITAT SAMPLED - 10 m macroinvertebrate sample area only

Habitat	Tick one	Habitat description (as per AUSRIVAS sampling guide)
Channel		Margins and central part of main channel, can sample along edges of bank; in leaf packs; woody debris; detritus (excludes riffles, macrophytes, fringing vegetation draped in water)
Macrophyte		Areas of submerged/floating/emergent and fringing vegetation draped in the water
Pool		Deeper areas with very slow-flowing water
Riffle		Areas of flowing, broken water over gravel, pebble, cobble or boulders

### MACROINVERTEBRATE HABITAT TYPE OVER ENTIRE 100 M SITE

See above for habitat description, this is different to stream habitat on the Aquatic Habitat field sheet [page 1 of 1]

Habitat	% of 100m site
Channel	
Macrophyte	
Pool	
Riffle	
Total	100%

# SAMPLE DEPTH

Average depth samp	ole taken (circle one)		
< 25 cm	< 50cm	< 100 cm	< 200 cm

### MINERAL SUBSTRATE AND HABITAT SURFACE AREA OF 10m MACROINVERTEBRATE SAMPLING AREA

Mineral substrate	%
Bedrock	
Boulders (> 256 mm or soccer ball)	
Cobble (64 - 256 mm or cricket to soccer ball)	
Pebble (16 - 64 mm or 5c piece to cricket ball)	
Gravel (4 -16 mm or raw sugar to 5c piece)	
Sand (1 – 4 mm)	
Silt (<1 mm)	
Clay (<0.002 mm)	
Total	100%

Habitat surface area	%	<b>Density</b> (circle) [1= sparse, 5 = dense]					
Mineral substrate	100	N/A					
Detritus		1	2	3	4	5	
Leaves		1	2	3	4	5	
Algae		1	2	3	4	5	
Woody debris (all sizes)		1	2	3	4	5	
Riparian veg draped in water		1	2	3	4	5	
Emergent macrophytes		1	2	3	4	5	
Submerged macrophytes		1	2	3	4	5	
Floating macrophytes		1	2	3	4	5	
Total (may be > 100%)							

### WATER VELOCITY (FLOW) AT MACROINVERTEBRATE SAMPLING SITE

Flow recorded on Gene	Yes	No (	complete tab	ole below)		
Meter or method used		Min velocity (m/s)		Max velo	ocity (m/s)	
Where flow was below t	he detection limit of the flow meter, was flo	w visually observed	Yes			No

Version 17 - July 2018

PLING AND PICKING CONDITIONS (circle)   Cle any applicable issues encountered in either sampling or picking that could affect results (add others if needed)   Clearly defined any applicable issues encountered in either sampling or picking that could affect results (add others if needed)   Clearly defined any applicable issues encountered in either sampling or picking that could affect results (add others if needed)   Clearly defined any applicable issues encountered in either sampling or picking that could affect results (add others if needed)   Clearly defined any applicable issues encountered in either sampling or picking that could affect results (add others if needed)   Clearly defined and interest in the whole sample in the sample or innitiated the abundance in the whole sample into each result in sample or in sample or in sample or in sample or in sample individuals picked individuals individuals picked individuals in the sample in	PLING AND PICKING CONDITIONS (circle)   Cle any applicable issues encountered in either sampling or picking that could affect results (add others if needed)   Clearly defined any applicable issues encountered in either sampling or picking that could affect results (add others if needed)   Clearly defined any applicable issues encountered in either sampling or picking that could affect results (add others if needed)   Clearly defined any applicable issues encountered in either sampling or picking that could affect results (add others if needed)   Clearly defined any applicable issues encountered in either sampling or picking that could affect results (add others if needed)   Clearly defined and interest in the whole sample in the sample or innitiated the abundance in the whole sample into each result in sample or in sample or in sample or in sample or in sample individuals picked individuals individuals picked individuals in the sample in	PLING AND PICKING CONDITIONS (circle)  le any applicable issues encountered in either sampling or picking that could affect results (add others if needed)  ampling None   Lots of woody debris   High flow   Steep   High flow   Steep   High flow   Steep   Clearly defined   Steep   Lots of floating macrophytes   Other:    Corrustaceans (tick)   Debrissapple   Lotwater   Clearly   Other:			Site code		EX OF RIVE	Recorder name		HEETS
